

Exercise – 1 → Singleton Pattern Example

Aim: To implement the Singleton Design Pattern in Java and ensure that only one instance of the Logger class is created throughout the application.

Files

- Logger.java
- Singleton.java

Description

The Singleton Pattern restricts the creation of a class to a single object and provides a global access point to that object.

Output

```
[Running] cd "c:\Users\savit\OneDrive" && java Singleton
Singleton.java && java Singleton
Logger Constructor
Message: Application started.
Message: User logged in.
Only one Logger instance exists.
Logger1 hashCode: 2061475679
Logger2 hashCode: 2061475679
```

Result

Singleton Design Pattern was implemented successfully and only one Logger instance was created.
